<b>Abstract</b>	<p><b>ENG</b></p> <p>Open Government Data (OGD) are the data produced by public institutions to promote transparency and accountability to citizens, as well as the creation of value and innovative services to be made available to society as a whole. The information value of OGD is very high, but their use in science (and beyond) is still marginal. There are many reasons for this limited use, but they can be summarized in the difficulty for the Public Administration to activate proper procedures for the production, documentation and dissemination of quality data, useful for users and especially ready for scientific analysis. The purpose of this research project is to develop strategies to increase the accessibility and use of OGD.</p>
