LOCAL UNIT MEMBER

- **2025-2026 ESA CarbonARA (Carbon Amazon Rainforest Airborne)**. The CarbonARA campaign carries out coordinated ground and airborne measurements across Pará, Brazil, to quantify carbon fluxes in degraded, secondary, and intact Amazon forests. Led by NCEO in collaboration with ESA, INPE, and UFOPA, the project strengthens carbon-cycle modelling and assesses regional climate-tipping risks. High-resolution airborne surveys capture land-cover transitions and monitor forest degradation, supporting Brazil's strategy to reduce emissions and accelerate ecosystem restoration. My contribution focuses on airborne data acquisitions, processing workflows, and SIF mapping.
- **2025-2026 ESA Fiducial Reference Measurements 4 FLUO (FRM4FLUO)**. The FRM4FLUO project develops standardized, traceable reference measurements to validate SIF for the FLEX mission. It integrates ground, UAV, and airborne observations—using systems such as HyPlant and FROG—to ensure consistency with FLORIS data. I lead the development of algorithms for processing SIF and reflectance data from ground, drone, and airborne platforms, supporting uncertainty assessment and the reliability of FLEX Level-2 products.
- **2023 ESA CalVal PARK**. The Cal/Val Park concept aims to fulfil the data and knowledge gaps in the current ground-based infrastructure, to address the Cal/Val needs of multi-spectral and hyperspectral optical sensor, with a medium to high and very-high spatial resolution.
- **2021 ESA SWATHSENSE Campaign**. Acquisition of multi-angular hyperspectral (VNIR-SWIR) and thermal data from ground and airborne platforms over rural areas.
- **2019-2022 ASI PRISCAV (PRISMA CAlibration/Validation)**. Calibration/Validation activity for the PRISMA imaging spectroscopy spaceborne mission.

The project aims at consolidating the atmospheric correction concept devloped for the FLEX mission through the collection, analysis and modeling of an comprehensive dataset of high-resolution field spectroscopy (downwelling radiance), sunphotometer and satellite observations
- **2014-2016 SOYFLEX, European Space Agency (ESA).** The project further supported the testing of the HyPlant airborne sensor to retrieve solar-induced chlorophyll fluorescence and canopy VSWIR reflectance over different targets and sites. The red and far-red fluorescence maps were computed by three retrieval methods (1) The 'singular vector deconvolution' (SVD) uses solar Fraunhofer lines; (2) The iFLD method; (3) The'Spectral Fitting Method' (SFM). The analyses were extended to a dedicated experiment with two different soybean varieties. In addition, the effect of a shadow and quick light exposure on photosynthesis, fluorescence and canopy temperature was investigated ('virtual cloud experiment') to generate specific scientific results to support FLEX mission.
